## UCS1903

## 3-Channel LED Driver / Controller

## GENERAL DESCRIPTION

The UCS1903 is a 3 -channel LED display driver / controller with a built-in MCU digital interface, data latches and LED high voltage driving functions. It features superior performances and reliable functions. Under the control of the external MCU, it performs independent grayscale control and cascading control for driving large outdoor colour dotmatrix LED panels.

## FEATURES

- 12 V -rated output port.
- 6 V to 12 V operating voltage.
- Grayscle adjustment function (256-level adjustable grayscle).
- Built-in dual RC oscillators for clock synchronization with the signals on the data line. After the first data is received, the subsequent data will be shaped and forwarded automatically.
- Built-in power-on reset function.
- 256-level adjustment is possible through the PWM control, with the scanning frequency up to $400 \mathrm{~Hz} / \mathrm{s}$.
- Serial cascade interface, with the data received and decoded on one wire.
- Unlimited cascading is possible in linear transfer mode.
- Over 10 -meter transfer distance between any two points. No additional circuitry is necessary.
- At the refresh speed of 30 frames / s, up to 512 cascaded dots are possible at the low-speed mode, and up to 1024 cascaded dots are possible at the highspeed mode.
- Data transfer rates of up to 400 kbps or 800kbps.

## PIN CONFIGURATION

PIN DESCRIPTION

| Number | Symbol | Name | Function Description |
| :---: | :---: | :---: | :--- |
| 1 | OUTR | LED drive output | Red PWM control output |
| 2 | OUTG | LED drive output | Green PWM control output |
| 3 | OUTB | LED drive output | Blue PWM control output |
| 4 | GND | Ground | Ground |

## FUNCTIONAL DESCRIPTION

The UCS1903 sends signals in return to zero codes with a single-wire communication method. When the power-on reset is completed, the UCS1903 receives the data from the DIN pin. When all the 24 bits of data have been received, the DOUT port starts to forward the data to the next chip as its input data. The DOUT pin is held LOW before the data forwarding, and the chip does not receive new data. The three PWM output ports, OUTR, OUTG and OUTB, send signals in a 4 -ms period, with different duty cycles corresponding to the 24 -bit data received. If the input signal from the DIN pin is a RESET signal, the UCS1903 will send the received data for display. When the signal is completed, the UCS1903 will receive new data. When all the initial 24 bits of data have been received, the UCS1903 will forward the data through the DOUT pin. Before the RESET signal is received, the output at the OUTR, OUTG and OUTB pins will remain unchanged. When a low level RESET code longer than $24 \mu$ s is received, the UCS1903 will output the 24 -bit PWM data just received to the OUTR, OUTG and OUTB pins.

The UCS1903 employs an automatic shaping-forwarding technique, so the number of the cascaded chips is not limited by the signal transfer, and is only limited by the panel refresh speed. For example, in a 1024-chip cascaded design with the panel refresh time of 1024X0.4X2 $=0.8192 \mathrm{~ms}$ (the data delay time of the UCS1903 is $0.4 \mu \mathrm{~s}$ ), no flickering will appear.

## UCS1903

## TIMING WAVEFORMS

1 Input code

## 2 Low-speed mode time

| Name | Description | Typ. value | Allowable error |
| :---: | :--- | :---: | :---: |
| T0H | code 0, high level time | $0.5 \mu \mathrm{~s}$ | $\pm 150 \mathrm{~ns}$ |
| T1H | code 1, high level time | $2.0 \mu \mathrm{~s}$ | $\pm 150 \mathrm{~ns}$ |
| TOL | code 0, low level time | $2.0 \mu \mathrm{~s}$ | $\pm 150 \mathrm{~ns}$ |
| T1L | code 1, low level time | $0.5 \mu \mathrm{~s}$ | $\pm 150 \mathrm{~ns}$ |

Note: In the high-speed mode, only half of the above time is needed (the time for code RESET is not changed).

## 3 Connection scheme

## UCS1903

## 4 Data transfer format

Note: D1 is the data sent from the MCU, D2, D3 and D4 are the data automatically shaped and forwarded by the cascaded circuit.

## 5 24-bit data format

| R7 | R6 | R5 | R4 | R3 | R2 | R1 | R0 | G7 | G6 | G5 | G4 | G3 | G2 | G1 | G0 | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Note: The data is sent in the sequence of RGB, and the MSB is sent first.

## UCS1903

## APPLICATION DIAGRAM

## UCS1903

The power supply voltage for the UCS1903 may be selected from 6 V to 12 V . A 104 capacitor between the power supply and the ground should be connected as close to the UCS1903 package as possible, and the PCB traces should be as short as possible. A resistor R should be connected between the power supply and the VDD pin, with the resistance value determined in reference to the supply voltage. The recommended resistance value is as follows:

| Supply Voltage | Recommended power supply resistor value |
| :---: | :---: |
| 6 V | $1 \mathrm{k} \Omega$ |
| 9 V | $4 \mathrm{k} \Omega$ |
| 12 V | $7 \mathrm{k} \Omega$ |

In practical applications, the VDD voltage is constant at about 5 V . When the SET pin is connected to high level, it should be connected to VDD. It should not be connected to external Power supply VCC, so as to prevent chip breakdown.
